The natural night is vanishing

Plants and animals depend on Earth's daily light and dark cycle to govern life-sustaining systems behaviors. Research shows that artificial light at night has adverse and even deadly effects on many species.

Millions of birds die each year, drawn off course or colliding with needlessly illuminated buildings at night.

Bright, unshielded lights lure hatchling sea turtles away from the safety of the ocean and into deadly city streets.

Every year, new research adds even more wildlife to the list of affected animals, including butterflies, moths, fireflies, bats, bees, hummingbirds, clownfish, coral, and many more.

Protect nocturnal habitats

Protect the nighttime environment around your home and community by following the Five Principles for Responsible Outdoor Lighting.
